Evoke Assessment

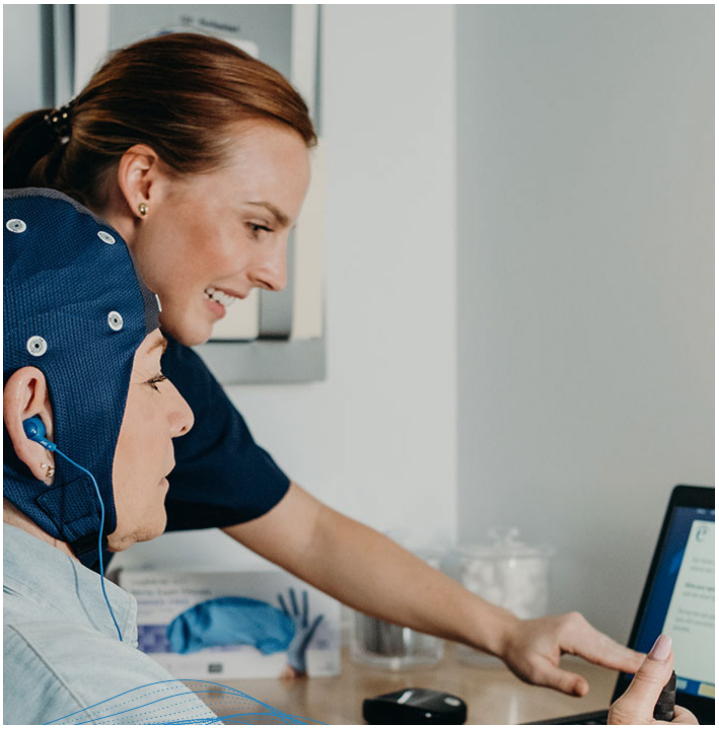

What is an Evoke Assessment?

Evoke assesses brain health by measuring key functions through a quick, non-invasive procedure. Using advanced EEG technology, it captures electrical activity in the brain, providing insights into brain processing speed, cognitive function, and mental health.

During the scan, an electrode cap is placed on your head to monitor your brain's electrical signals while you complete simple tasks, such as reacting to visual or auditory cues. These tasks help assess how quickly and efficiently your brain processes information. The test also evaluates cognitive performance and emotional well-being through standardized behavioral assessments.

Evoke detects early signs of cognitive issues before symptoms appear. By identifying potential brain health concerns early, it allows doctors to create targeted, personalized treatment plans. Early intervention can prevent or delay the progression of cognitive decline, improving long-term health outcomes.

BENEFITS OF Evoke ASSESSMENT

- Identify cognitive issues before symptoms appear, allowing for early treatment to slow or prevent decline.
- Receive tailored treatment based on real-time insights into your brain's activity.
- Early detection of treatable issues that affect brain function are helpful when determining treatment plans.

STEPS TO EVOKE

STEP 01

Evoke Education and Scheduling

Your Salience Health Provider may have recommended that you learn about Evoke as part of your new patient intake. A Salience Health Care Navigator will guide you through this educational process, along with any other necessary information. After the education session, you'll have the option to schedule your Evoke Assessment. If you have questions about costs and insurance coverage, our team can assist you. You can pay when scheduling your appointment or on the day of testing.

STEP 02

Day of Testing

On the day of the test, please avoid stimulants, but you can take your regular prescription medication. Ensure clean, dry hair and wear comfy clothing. Minimize caffeine and aim for a good night's sleep. You can drive normally as the only residue will be water-soluble gel used during setup.

Upon arrival, a technician will guide you to a testing room. You'll fill out a questionnaire while the technician prepares. They'll place a cap with electrodes on your head, applying harmless saline gel to your scalp to capture your brain's and heart's natural signals for observation.

Please note: if you have any open wounds on your scalp, you should push out testing until they have healed.

STEP 03

The Assessment and Results

The assessment appointment can take up to 90 minutes. This includes observing and measuring response metrics, heart metrics, event related potentials (ERP's), EEG head maps, and source localization. Afterward, the technician removes the cap and provides a gel cleaner.

Your results will be ready at your next appointment with your provider
These results are for your provider's assessment, but you can request a copy.
Remember, your provider's guidance is crucial for interpreting the results and planning your treatment.
